

A Corpus Analysis of Plesionyms *Attribute, Characteristic, and Trait* in Academic English

Sadie M. M. Nitta*

Hawaii Pacific University

Abstract

This paper investigates the plesionyms *attribute*, *characteristic*, and *trait* using the Corpus of Contemporary American English (COCA). It explores their frequency and variation across COCA's six registers and sub-registers, then examines their grammatical behaviors and semantic preference and prosody through concordancing in COCA's academic journals (ACAD). The results show that *attribute* mostly occurs in academic journals related to business, science/technology, and education; *characteristic* mostly occurs in academic journals related to business, education, and medicine; and *trait* mostly occurs in academic journals related to science/technology, philosophy/religion, and business. Noun collocations associated with each term suggest a strong preference for standards/quality with positive semantic prosody (*attribute*), demographics/species/property with neutral semantic prosody (*characteristic*), and cognition/behavior/genetics with neutral semantic prosody (*trait*). The paper concludes with a set of materials for one corpus-informed lesson following the Illustration-Induction-Interaction (I-I-I) model (Timmis, 2015).

Introduction

Differentiating between plesionyms, or near-synonyms, that frequently occur in Academic English (AE) is useful for lexical choice in discourse. Although there is a consensus among linguists that true synonymy is “quite rare” (Hirst, 1995, p. 51), dictionaries and thesauri often characterize such words as identical in meaning, which can be “very misleading” to language learners (Biber et al., 2007, p. 43). This paper aims to investigate the plesionyms—more specifically, noun near-synonyms – *attribute*, *characteristic*, and *trait* using the Corpus of Contemporary American English (COCA). First, it identifies their frequency and variation across COCA's six registers and sub-registers, then assesses their (a) grammatical behaviors and (b) semantic preference and prosody across COCA's academic journals (ACAD) via concordancing. Finally, it provides a set of materials designed for one corpus-informed lesson following the Illustration-Induction-Interaction (I-I-I) model (Timmis, 2015), including English as a Second Language (ESL) teaching implications in academic prose.

The Target Nouns: What We Already Know About Their Form, Meaning, and Use

According to *Longman Student Grammar of Spoken and Written English* (Biber et al., 2002), nouns can be grouped into a small number of classes – concrete, abstract, countable, uncountable, proper, common, and package – which differ in meaning and grammatical behavior (p. 56). In this paper, the target nouns under examination are *attribute*, *characteristic*, and *trait*.

Attribute, *characteristic*, and *trait* represent common countable nouns, which account for singular and plural forms. Furthermore, the target nouns are considered abstract nouns, which refer to abstractions such as events, states, times, and qualities. According to Biber et al. (2002), “The

Nitta, S. M. M. (2023). A corpus analysis of plesionyms *attribute*, *characteristic*, and *trait* in academic English. *TESOL Working Paper Series*, 21, 80-120.

distinction between concrete and abstract is purely semantic: it has no real grammatical role, since abstract nouns, like concrete nouns, can be countable, uncountable, common, or proper” (p. 57). So far, there is no strong distinction between the forms of nouns *attribute*, *characteristic*, and *trait*.

Looking closely at the origins and meanings of nouns *attribute*, *characteristic*, and *trait* is important for setting up the investigation. Based on *Merriam-Webster.com*, Figure 1 displays their etymology, dictionary definitions, and example phrases (“attribute,” 2022; “characteristic,” 2022; “trait,” 2022). Although *characteristic* derives from Greek and *attribute* and *trait* derive from Latin, all three target nouns entered English through French. Their core meanings refer to the ‘quality’ of something, and the dictionary definitions are insufficient to differentiate them for language use, which necessitates a corpus analysis. In addition, the *Merriam-Webster.com* examples given for *characteristic* and *trait* show that they both can be used as “species noun” (Biber et al., 2002, p. 64) – often followed by an *of*-phrase to refer to the type of something. This background knowledge on these words will provide greater insight to this paper’s investigation and findings.

The Phenomenon of Plesionymy (or Near-Synonymy)

Plesionymy, or near-synonymy, refers to two or more words that are close in meaning but “not fully inter-substitutable” (Hirst, 1995, p. 51). Plesionyms can vary in more than one way, such as their connotation, denotation, emphasis, implicature, register, style, or use (Cruse, 1986; DiMarco et al., 1993; Edmonds, 1999). According to Hirst (1995), “It is difficult even for native speakers of a language to command the differences between plesionyms well enough to use them with invariable precision, or to articulate those differences even when they are known” (p. 51). As a result, lexical choice and transfer issues are common for language learners.

Past research can help determine what kinds of differences exist between plesionyms. For example, Gove (1984) analyzed the noun plesionyms *lie*, *misrepresentation*, *fib*, *falsehood*, and *untruth* in context. Gove’s (1984) analysis revealed the differences in focus and register amongst these plesionyms (e.g., *misrepresentation* and *untruth* are used euphemistically, whereas *lie* is deliberate and direct; *fib* is used informally and seen as childish, whereas *falsehood* is formal). In another example, Gove (1984) discovered that the difference between the noun plesionyms *enemy* and *foe* is that *enemy* emphasizes antagonism or hatred while *foe* emphasizes active fighting. Room (1985) determined specific differences between the noun plesionyms *forest* and *wood(s)*. According to Room (1985), “A ‘wood’ is smaller than a ‘forest,’ is not so primitive, and is usually nearer to civilization. This means that a ‘forest’ is fairly extensive, is to some extent wild, and on the whole not near large towns or cities. In addition, a ‘forest’ often has game or wild animals in it, which a ‘wood’ does not, apart from the standard quota of regular rural denizens such as rabbits, foxes and birds of various kinds...” (p. 270). These differences are context-driven and weigh heavily on one’s lexical choice.

Issues related to lexical choice and first language (L1) transfer are quite similar for language learners. Language learners are likely to choose a word in the target language that is closest to a word in their first language. Often, these L1 transfers show examples of plesionyms, not true synonyms (Hirst, 1995). For instance, the German word *Wald* is part of the cross-linguistic plesionym group *forest*, *wood(s)*, and *Wald*. According to Hirst (1995), “the German word *Wald* is close in meaning to the English word *forest*, but *Wald* can denote a rather smaller and more urban area of trees than *forest*” (p. 52). In contrast to Room’s (1995) analysis of the plesionyms *forest* and *wood(s)*, it is clear that in some situations, *woods* would be a better translation of *Wald* than *forest*. Meaning differences between plesionyms can be targeted using four broad categories based on Cruse (1986) and Edmond’s (1999) research: denotational variation, stylistic variation (including dialect and register), expressive variation (including emotive and attitudinal aspects), and structural variation (including collocational, selectional, and syntactic variations).

Data Driven Learning in Second Language Acquisition and English Language Teaching

The theoretical foundation for Data Driven Learning (DDL) in Second Language Acquisition (SLA) and teaching is the proven value of examining naturally occurring language in context (authenticity) and promoting self-sufficiency in language learning (autonomy) (Timmis, 2015; Friginal, 2018; Green, 2019). One advantage of DDL is the quantity and quality of language evidence, which enables teachers and learners to write comprehensive descriptions and confirm, refute, or refine a language hypothesis (Timmis, 2015). In this light, learners truly become investigators of the language as the teacher guides them through the generalization process towards independent learning.

Through DDL, corpora are recognized as a special type of informant, not a tutor or surrogate teacher (Johns, 1991). Teacher guidance is necessary in the training and initial exploration of the computing tool. Friginal (2018) and other experts suggest that teachers should take on the role of

director and coordinator in DDL. Furthermore, Timmis (2015) states that “Corpus-informed teachers, arguably, will be better placed to make opportunistic decisions in the [ESL] classroom about what vocabulary to highlight from listening or reading texts or from classroom discussions” (p. 53). From this standpoint, DDL can result in memorable learning and teaching moments.

Although there are notable challenges with the implementation of corpus technology, past research has outlined several pedagogical benefits. Most famously, Johns and King (1991) published three primary conclusions — based on exploratory case studies with students (overseas postgraduates in a wide range of subject areas who need to improve their English for instrumental reasons) — about students using concordance output regularly:

1. Using concordancing, learners can develop the ability to see patterning in the target language and to form generalizations to account for that patterning.
2. The teacher has to learn to become a director and coordinator of student-initiated research.
3. Traditional grammar teaching is top-down; DDL is bottom-up.

Concerning the first conclusion, O’Keeffe et al. (2007) recommend creating a lexico-grammatical profile for target vocabulary via concordancing. This corpus strategy leads learners towards making their own generalizations by inviting them to explore a target words’ collocates, chunks/idioms, syntactic restrictions, semantic restrictions, prosody, and other relevant or recurring features (pp. 14-15). Due to the overwhelming amount of data, teachers can also use guiding questions with varying degrees of control to help familiarize students with the generalization process. Although there is hesitation amongst teachers to incorporate corpus technology in the classroom, perception studies have shown that “many students enjoy DDL as a novel learning approach” (Vyatkina & Boulton, 2017, p. 1).

Research Questions

1. How frequently are the nouns *attribute*, *characteristic*, and *trait* used in different registers? How frequently are they used in different sub-registers?
2. What are the differences in the semantic preferences of nouns *attribute*, *characteristic*, and *trait* in Academic English?
3. What are the differences in the semantic prosody of nouns *attribute*, *characteristic*, and *trait* in Academic English?

Corpus

Created by Mark Davies (2008-), the Corpus of Contemporary American English (COCA) is a principled collection of natural texts, spanning over 1 billion words — 1,001,610,938, to be exact — and divided into eight registers (or genres): blogs (125 million words [125,496,215]); web pages (130 million words [129,899,426]); TV/movie subtitles (128 million words [128,013,334]); fiction (120 million words [127,352,014]); popular magazines (127 million words [127,352,014]); newspapers (123 million words [122,959,393]); and academic journals (121 million words [120,9388,348]). On the one hand, due to its large database, it is known as a general or reference corpus. On the other hand, due to its ever-increasing database, it is also known as a monitor corpus because users can ‘monitor’ how the language is used and changes over time. For this paper, the sub-registers of COCA’s academic journals (ACAD) or Academic English (AE) were also explored. According to Davies (2008-), COCA’s ACAD/AE sub-registers include nearly 100 peer-reviewed journals selected from a balance of history, education, geography/social science, law/political science, humanities, philosophy/religion,

science/technology, business, and miscellaneous. See <https://www.english-corpora.org/coca/> for more information.

Analysis

Research Question 1: How frequently are the nouns *attribute*, *characteristic*, and *trait* used in different registers? How frequently are they used in different sub-registers?

To account for all target forms of the nouns *attribute*, *characteristic*, and *trait*, the search string utilized was [attribute]_NN, [characteristic]_NN, and [trait]_NN in COCA.

Using the CHART function in COCA, the overall frequency per million of *attribute* is 14.32 (see Figure 2). For *characteristic*, the overall frequency per million is 38.11 (see Figure 3); and for *trait*, 18.63 (see Figure 4). This means that amongst these three nouns, *characteristic* is the most frequent, then *trait* and *attribute*. In addition, Figures 2 through 4 display the variation of *attribute*, *characteristic*, and *trait* over time (between 1990-2019). It appears that *trait* shows stronger signs of an upward trend (from 15.02 per mil in 1990-94 to 18.88 per mil in 2015-19).

Figure 2
Frequency and Register Variation of *attribute* in COCA

Figure 3
Frequency and Register Variation of *characteristic* in COCA

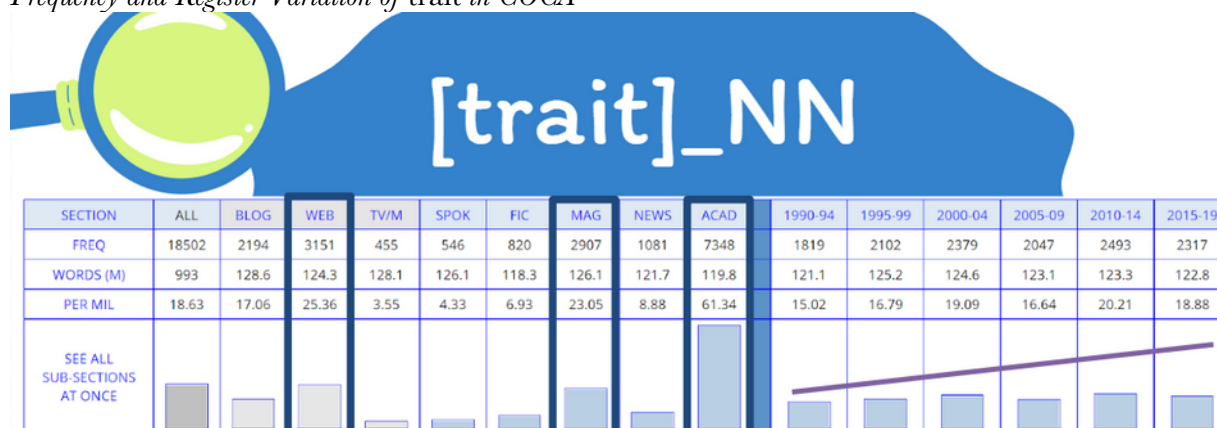

Figure 4
Frequency and Register Variation of *trait* in COCA

Returning to COCA's initial CHART search, one may also notice the high frequency registers for *attribute*, *characteristic*, and *trait* ([*attribute*]_{NN}, [*characteristic*]_{NN}, and [*trait*]_{NN}). Interestingly, they share the top three registers but in different order: *Attribute* mostly occurs in web pages (46.15 per mil), academic journals (40.91 per mil), and popular magazines (8.49 per mil). *Characteristic* mostly occurs in academic journals (206.85 per mil), web pages (34.16 per mil), and popular magazines (26.42 per mil). Lastly, *trait* mostly occurs in academic journals (61.34 per mil), web pages (25.36 per mil), and popular magazines (23.05 per mil). Something extremely interesting about this finding is that both *characteristic* and *trait* are more frequently used in academic journals than *attribute*. This result is reflective of the change between Coxhead's (2000) Academic Word List (AWL) and Gardner and Davies' (2013) Academic Vocabulary List (AVL): *Attribute* is included in the AWL but not included in AVL. Coxhead's (2000) AWL is limited to textbooks, whereas Gardner and Davies' (2013) AVL is larger and broader.

Next, the top sub-register of the top three registers were identified. The top sub-registers revealed a general tendency for academic themes (see Figures 5-7). For *attribute*, the top sub-registers include academic web pages (404.01 per mil), business academic journals (172.01 per mil), and science/technology popular magazines (12.78 per mil). For *characteristic*, the top sub-registers include business academic journals (401.63 per mil), academic web pages (190.99 per mil), and science/technology popular magazines (51.88 per mil). For *trait*, the top sub-registers include science/technology academic journals (129.48 per mil), academic web pages (101.09 per mil), and science/technology popular magazines (53.92 per mil). This further illustrates why these nouns are worth noting in Academic English (AE) and how they differ across registers (Cruse, 1986; DiMarco et al., 1993; Edmonds, 1999).

Figure 5
Frequency and Sub-Register Variation of attribute in COCA

Figure 6
Frequency and Sub-Register Variation of characteristic in COCA

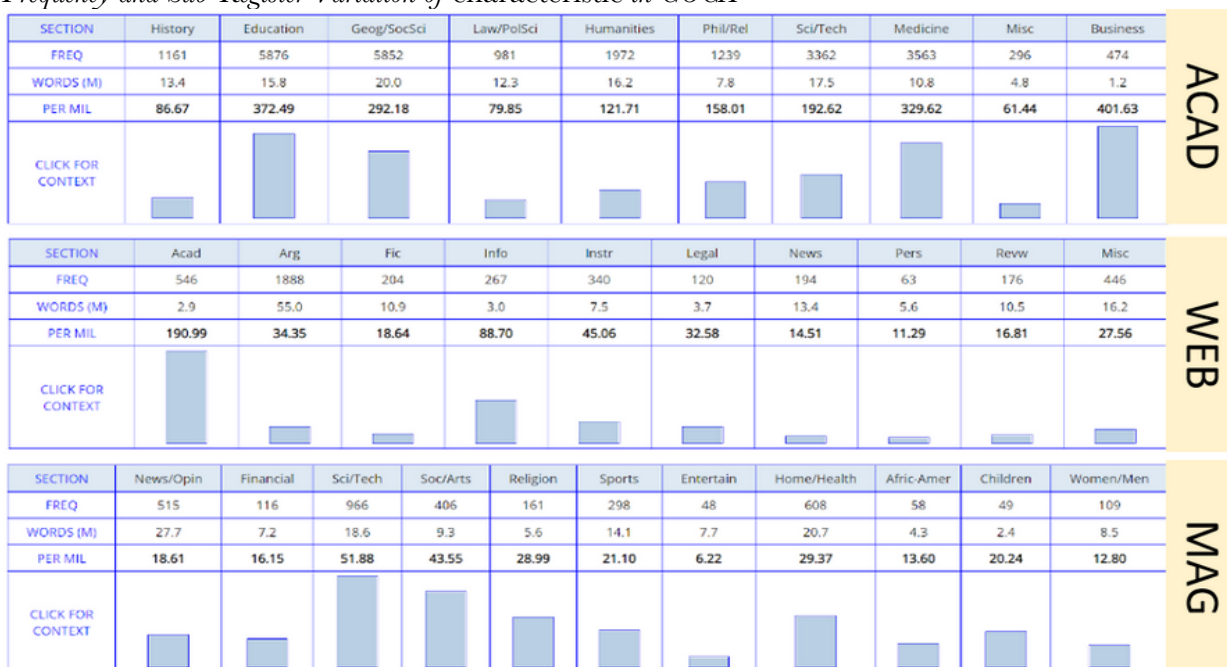

Figure 7
Frequency and Sub-Register Variation of trait in COCA

Focusing on COCA's academic journals (ACAD) register, the most frequent sub-registers of *attribute*, *characteristic*, and *trait* begin to reveal the nature and differences between these near-synonyms. As shown in Figures 5 through 7, *attribute* mostly occurs in academic journals related to business (172.01 per mil), science/technology (55.52 per mil), and education (53.69 per mil); *characteristic* mostly occurs in academic journals related to business (401.63 per mil), education (372.49 per mil), and medicine (329.62 per mil); *trait* mostly occurs in academic journals related to science/technology (129.48 per mil), philosophy/religion (113.88 per mil), and business (104.22 per mil). In all, the most frequent academic journals across all three are business, science/technology, and education. These are the sub-registers that will be explored in the next set of questions.

Research Question 2: What are the differences in the semantic preferences of nouns *attribute*, *characteristic*, and *trait* in Academic English?

Using the COLLOCATES function in COCA, the top 30 collocates of *attribute* ([attribute_NN]), *characteristic* ([characteristic_NN]), and *trait* ([trait_NN]) were analyzed in the left (1L) and right (1R) contexts in COCA's academic journals (see Tables 1-2). Then, using the same search string, the top 15 verb, noun¹, adjective, and adverb collocates were identified separately in the left (1L) and right (1R) contexts in COCA's academic journals (see Tables 3-12). Based on this initial search, the semantic preferences among *attribute*, *characteristic*, and *trait* begin to emerge.

¹ Noun collocates required further investigation. Using the same search string, the top 15 noun collocates were identified in the left (1L, 6L) and right (1R, 6R) contexts in COCA's academic journals (see Tables 5-8).

Table 1
 Top 30 Collocates (1L) of attribute, characteristic, and trait in COCA's Academic Journals

#	attribute	characteristic	trait
1	<i>the</i> (563)	<u>the</u> (2,300)	<i>the</i> (556)
2	<i>of</i> (170)	demographic (1,008)	<u>personality</u> (476)
3	<i>these</i> (159)	<u>these</u> (623)	<i>of</i> (296)
4	<i>an</i> (158)	<u>and</u> (481)	<i>and</i> (204)
5	<i>physical</i> (117)	<u>.</u> (386)	<i>a</i> (202)
6	<i>personal</i> (97)	<u>personal</u> (351)	<i>these</i> (196)
7	<i>and</i> (95)	<u>of</u> (349)	character (173)
8	<i>other</i> (94)	<u>physical</u> (325)	<i>,</i> (121)
9	positive (77)	<u>,</u> (292)	<i>this</i> (119)
10	<i>important</i> (57)	student (291)	type (91)
11	<i>'s</i> (53)	<i>personality</i> (281)	cultural (89)
12	each (49)	<u>a</u> (253)	quantitative (67)
13	<i>,</i> (48)	<u>other</u> (248)	that (65)
14	those (41)	<u>individual</u> (216)	<i>other</i> (63)
15	<i>individual</i> (40)	<u>common</u> (206)	<i>.</i> (55)
16	negative (40)	unique (203)	<i>personal</i> (55)
17	key (39)	defining (195)	<i>common</i> (53)
18	different (38)	<u>important</u> (170)	between (51)
19	three (37)	sociodemographic (170)	for (50)
20	<i>cultural</i> (36)	sample (160)	<i>behavioral</i> (49)
21	<i>“</i> (33)	<u>specific</u> (157)	<i>positive</i> (49)
22	its (33)	background (145)	<i>physical</i> (47)
23	<i>or</i> (31)	essential (136)	quality (45)
24	<i>‘</i> (28)	<u>‘</u> (130)	in (44)
25	creative (27)	<u>behavioral</u> (130)	or (44)
26	<i>human</i> (26)	baseline (127)	“ (43)
27	job (26)	<u>certain</u> (123)	human (43)
28	their (26)	similar (123)	with (43)
29	<i>with</i> (26)	clinical (122)	phenotypic (42)
30	<i>specific</i> (25)	<u>this</u> (121)	<i>certain</i> (40)

Note. Distinct collocates are in bold, while overlapping collocates occurring at different frequencies are both underlined and bolded in the column with the highest frequency.

As shown in Table 1, *attribute*, *characteristic*, and *trait* each tend to follow different types of adjectives more than other parts of speech. Given the predicted contexts in which one uses *attribute*, *characteristic*, and *trait* – when seeking to describe or compare something – this finding makes sense. (The most frequent adjective collocates will be explored further in Tables 9 and 10.)

Table 2
 Top 30 Collocates (1R) of attribute, characteristic, and trait in COCA's Academic Journals

#	attribute	characteristic	trait
1	<i>of</i> (1,213)	<i>of</i> (9,068)	, (715)
2	. (509)	<u>. (2,328)</u>	. (622)
3	, (506)	<u>, (2,015)</u>	<i>of</i> (621)
4	<i>and</i> (271)	<i>and</i> (1,577)	<i>and</i> (433)
5	<i>that</i> (199)	<i>that</i> (965)	<i>that</i> (432)
6	((189)	<u>((940)</u>	<i>in</i> (356)
7	<i>are</i> (131)	<i>are</i> (491)	<i>anxiety</i> (309)
8	<i>in</i> (114)	<i>in</i> (432)	((212)
9	<i>to</i> (82)	<i>were</i> (290)	<i>are</i> (184)
10	<i>were</i> (78)	<u>: (286)</u>	<i>is</i> (104)
11	<i>such</i> (68)	<i>such</i> (279)	<i>to</i> (89)
12	<i>is</i> (56)	<i>for</i> (236)	<i>or</i> (88)
13	<i>or</i> (56)	<i>as</i> (232)	<i>such</i> (87)
14	<i>as</i> (52)	<i>to</i> (223)	<i>arousability</i> (79)
15	: (51)	<i>is</i> (187)	: (76)
16	<i>for</i> (47)	<i>or</i> (181)) (73)
17) (38)	<i>with</i> (174)	<i>for</i> (70)
18	<i>was</i> (35)	<i>on</i> (171)	<i>as</i> (67)
19	<i>can</i> (34)	<i>associated</i> (161)	<i>were</i> (61)
20	; (32)	<u>) (111)</u>	<i>may</i> (57)
21	<i>which</i> (26)	<i>may</i> (108)	<i>can</i> (56)
22	<i>have</i> (25)	<u>: (101)</u>	<i>with</i> (53)
23	“ (22)	<u>“ (94)</u>	<i>values</i> (49)
24	<i>agenda</i> (21)	<i>have</i> (91)	<i>associated</i> (47)
25	<i>with</i> (20)	<i>which</i> (90)	<i>was</i> (39)
26	<i>may</i> (19)	<i>can</i> (86)	<i>like</i> (38)
27	<i>associated</i> (18)	<i>by</i> (82)	; (37)
28	<i>used</i> (17)	<i>from</i> (77)	<i>from</i> (36)
29	<i>on</i> (16)	<i>was</i> (72)	<i>anger</i> (31)
30	<i>by</i> (15)	<i>related</i> (61)	<i>dominance</i> (30)

Note. Distinct collocates are in bold, while overlapping collocates occurring at different frequencies are both underlined and bolded in the column with the highest frequency.

As shown in Table 2, *attribute*, *characteristic*, and *trait* each tend to participate in *of*-phrases. This suggests that these target nouns are often associated with the concept or entity being described. It is worth noting this before looking at high frequency noun collocates in the right contexts (Tables 6, 8).

As shown in Tables 3 and 4, *attribute* tends to occur with action verbs (e.g., *assigned*), *characteristic* with communication verbs (e.g., *describe*), and *trait* with mental verbs (e.g., *coping*). This suggests a subtle difference in the real-world processes these nouns engage in respectively.

Top 15 Noun Collocates of attribute, characteristic, and trait in the Right Context (1R) in ACAD

#	attribute	characteristic	trait
1	agenda (21)	curves (13)	anxiety (309)
2	<u>questionnaire</u> (12)	table (9)	arousability (79)
3	<i>values</i> (9)	<i>questionnaire</i> (9)	<u>values</u> (46)
4	levels (8)	curve (7)	anger (31)
5	weights (8)	inventory (6)	dominance (30)
6	extraction (6)	<u>variables</u> (5)	measures (23)
7	scores (6)	capital (4)	variation (22)
8	set (6)	survey (4)	heritability (21)
9	agenda-setting (6)	subjects (3)	engageability (20)
10	blocks (5)	respondents (3)	value (20)
11	aggregation (4)	ratings (3)	loci (18)
12	information (4)	music (3)	measure (18)
13	preferences (4)	model (3)	evolution (17)
14	<i>variables</i> (3)	parents (3)	hope (17)
15	selection (3)	constant (2)	sport (16)

Note. Distinct collocates are in bold, while overlapping collocates occurring at different frequencies are both underlined and bolded in the column with the highest frequency.

As shown in Tables 5 and 6, *attribute* tends to occur with abstract nouns related to products of negotiation, such as standards/quality (e.g., *problem, preferences*), *characteristic* with concrete nouns related to demographics/species/property (e.g., *student, respondents*), and *trait* with abstract nouns related to cognition/behavior/genetics (e.g., *depression, anxiety*). This suggests the types of nouns these target words tend to describe: whether they are abstract vs. concrete, observable vs. latent, or living vs. non-living. For more information, an additional search for noun collocates was conducted in the left (6L) and right (6R) contexts.

Interestingly, as shown in Table 7 and 8, *characteristics* is a common collocate for nouns *attribute*, *characteristic*, and *trait*. Using concordancing, Example Set A provides more context on how the target nouns are used differently.

Example Set A: Concordance Lines of *attribute* and *trait* co-occurring with *characteristic*

- (1) ...*father-school community is determined by a combination of family characteristics and program attributes...*
<ACAD: School of Psychology Review, 2005>
- (2) ...*a combination of individual factors (e.g., personality traits), home/family characteristics (e.g., roles, responsibilities)...* <ACAD: Journal of Instructional Psychology, 2008>

The first line starts to reveal a meaning difference between *characteristic* and *attribute*. In this case (Line 1), *characteristic* is defining a *family* (a concrete, living thing; more specifically, a human unit), whereas *attribute* is defining a *program* (an abstract, non-living thing). The second line also starts to reveal a meaning difference between *trait* and *characteristic*. Line 2 shows that *trait* tends to occur with abstract nouns related to cognition/behavior/genetics, whereas *characteristic* tends to occur with concrete nouns related to demographics/species/property. This reaffirms the generalization made based on Tables 5 and 6.

Table 7

Top 15 Noun Collocates of attribute, characteristic, and trait in the Left Context (6L) in ACAD

#	<i>attribute</i>	<i>characteristic</i>	<i>trait</i>
1	attributes (48)	<u>table</u> (1,016)	<u>personality</u> (506)

10	<i>only</i> (2)	<i>significantly</i> (5)	<i>frequently</i> (3)
11	<i>wholly</i> (1)	<i>differently</i> (4)	<i>as</i> (3)
12	<i>usually</i> (1)	<i>typically</i> (4)	<i>commonly</i> (3)
13	<i>traditionally</i> (1)	<i>traditionally</i> (4)	<i>already</i> (2)
14	<i>too</i> (1)	<i>that</i> (3)	<i>directly</i> (2)
15	<i>together</i> (1)	<i>strongly</i> (3)	<i>even</i> (2)

Note. Distinct collocates are in bold, while overlapping collocates occurring at different frequencies are both underlined and bolded in the column with the highest frequency.

As shown in Tables 9 and 10, *attribute* tends to occur with evaluative adjectives (e.g., *positive*, *important*), *characteristic* with topical adjectives (e.g., *personal*, *physical*), and *trait* with relational adjectives (e.g., *cultural*, *life-history*). In addition, for *characteristic*, the high frequency of *defining* suggests that a *characteristic* is fundamental to the thing being described and helps distinguish it from other things that may otherwise share some similarities or traits.

As shown in Tables 11 and 12, *attribute* tends to occur with adverbs of degree (e.g., *most*), *characteristic* with adverbs of degree (e.g., *significantly*), and *trait* with adverbs of frequency (e.g., *often*). This suggests that *attribute* and *characteristic* are fundamental to the thing being described and helps distinguish it from other things that may otherwise share similarities or traits. On the other hand, *trait* seems to emphasize things that are commonly observable.

Next, using the COMPARE function in COCA, the the top 50 collocates of *attribute* ([attribute_NN]), *characteristic* ([characteristic]_NN), and *trait* ([trait]_NN) were analyzed in the left (3L) and right (3R) contexts in COCA's academic journals (see Figures 8-13). Based on this next search, the semantic preferences among *attribute*, *characteristic*, and *trait* continue to emerge.

As shown in Figures 12 and 13, *characteristic* continues to show a strong preference for demographics/species/property (e.g., *demographic*, *participants*), whereas *trait* continues to show a strong

preference for cognition/behavior/genetics (e.g., *character*, *anxiety*). While traits are inherited, characteristics can be acquired or changed.

In summary, it seems that *attribute* tends to occur with action verbs (e.g., *assigned*), abstract nouns related to standards/quality (e.g., *value*), evaluative adjectives (e.g., *important*), and adverbs of degree (e.g., *most*). *Characteristic* tends to occur with communication verbs (e.g., *describe*), concrete nouns related to demographics/species/property (e.g., *student*), topical adjectives (e.g., *physical*), and adverbs of degree (e.g., *significantly*). *Trait* tends to occur with mental verbs (e.g., *coping*), abstract nouns related to cognition/behavior/genetics (e.g., *anxiety*), relational adjectives (e.g., *life-history*), and adverbs of frequency (e.g., *often*). Lastly, *traits* tend to describe things that are inherited, whereas *characteristics* can describe things that are acquired.

To illustrate, consider the following examples for their semantic preferences:

Example Set 1: Concordance Lines of *attribute*

- (1) *These attributes were identified by a panel of experts composed of recognized members of the art education community.* <ACAD: Arts Education Policy Review, 1996>
- (2) *The beliefs about the nature of power, and the values and attributes associated with warriors and hunters...* <ACAD: Africa Today, 1994>
- (3) *What are the important attributes that you consider while buying an apartment?* <ACAD: The Journal of Real Estate Research, 2016>
- (4) *In both classes, the enjoyability of classes ranks as one of the most important attributes...* <ACAD: Economic Inquiry, 2018>

Example Set 2: Concordance Lines of *characteristic*

- (1) *However, participant characteristics are reported separately for lead teachers and teaching assistants.* <ACAD: Language, Speech & Hearing Services in Schools, 2014>
- (2) *The most typical student characteristics indicated a U.S.-born (65.7%) female (51.5%) majoring in accounting (29.8%) who started college at this university (52.2%) and who was working part-time (63.8%).* <ACAD: Academy of Business Research Journal, 2016>
- (3) *Currently, the demographic characteristics of tattooed persons show wide variations in gender, age, social class, race, political party and occupation.* <ACAD: College Student Journal, 2015>
- (4) *However, these characteristics are disproportionately found in the lower socioeconomic, high-crime, older neighborhoods that racial minorities often call home.* <ACAD: Vanderbilt Law Review, 2017>

Example Set 3: Concordance Lines of *trait*

- (1) *Because each human's genes are unique, they are a personal map for that person's biological past and future — the traits inherited from parents and the ones to be passed on to children.* <ACAD: ABA Journal, 1998>
- (2) *...for generalized anxiety disorder or panic attack for anxiety traits, and for major depressive disorder for depression traits.* <ACAD: Journal of Sport Behavior, 2000>
- (3) *Unusual behavioral traits allow the fire ant to form large colonies and to dominate the territories it invades.* <ACAD: Bioscience, 1994>
- (4) *Traits can be thought of as falling along a continuum that ranges from traits considered by many to be desirable (e.g., *happy*, *self-confident*, *considerate*) to traits that are *often* considered to be undesirable (e.g., *aggressive*, *spiteful*, *crude*).* <ACAD: Journal of Instructional Psychology, 1999>

Furthermore, a Google search using the common construction (noun + *of*-phrase) with *attribute*, *characteristic*, and *trait* reveals similar semantic preferences based on the search engine's predicted text (see Figure 14).

Figure 14

Google Search Prompts with *attribute of*, *characteristic of*, and *trait of*

<i>attribute of</i>	<i>characteristic of</i>	<i>trait of</i>
<ul style="list-style-type: none"> Q attribute of a class Q attribute of parallel hybrid technology Q attribute of an object Q attribute of love Q attribute of shapes Q attribute of udp Q attribute of god 	<ul style="list-style-type: none"> Q characteristic of a leader Q characteristic of life Q characteristic of living things Q characteristics of arthropods Q characteristics of golden retrievers Q characteristics of fungi Q characteristic of civilization Q characteristic of metals Q characteristic of an organic compound 	<ul style="list-style-type: none"> Q trait of a narcissist Q trait of a person Q trait of a leader Q trait of character Q trait of autism Q trait of character Q trait of a taurus

Research Question 3: What are the differences in the semantic prosody of nouns *attribute*, *characteristic*, and *trait* in Academic English?

Using the COLLOCATES and COMPARE functions in COCA, the semantic prosody of *attribute* ([attribute_NN]), *characteristic* ([characteristic]_NN), and *trait* ([trait]_NN) was determined. To summarize the findings, consider the following examples for their semantic prosody:

Example Set 4: Concordance Lines of *attribute*, *characteristic*, and *trait*

- (1) *Security is an important attribute of any good or service...*
- (2) *The most typical student characteristics indicated a U.S.-born (65.7%) female (51.5%)...*
- (3) *In fact, risk-taking is one personality trait that is most of the time connected with entrepreneurs.*

For *attribute* (Line 1), the noun often occurs in a context with positive meaning and an authoritative tone. For *characteristic* (Line 2), the noun often occurs in a context with neutral meaning and an informative tone. Lastly, for *trait* (Line 3), the noun often occurs in a context with neutral meaning and an authoritative tone. One other interesting feature of *attribute* is its tendency to describe things that are non-living (Line 1), whereas *trait* tends to describe things that are living (Line 3). This semantic restriction is similar to Room's (1985) explanation of a *wood* and *forest* and could potentially impact lexical choice and L1 transfer in translation (Hirst, 1995). When looking at the closest translation of *trait* in Japanese, 特性 (とくせい, *tokusei*), a quick survey from my Japanese students revealed that it is also primarily used to describe living things. In that case, the cross-linguistic plesionym group *attribute*, *trait*, and *tokusei* may be a non-issue for Japanese learners of English.

Application

Target Population

The target students for this application are adults (from over 70 countries) studying Academic English (AE) at university. They are currently enrolled in an advanced level (C1) writing course. Students can successfully discuss in detail issues related to success, including building a motivated team, and understand various communication styles (or registers). By the end of the term, the students' goal is to move up to C2, which enables students to explore science and technology and promotes creativity in writing. These themes and goals are highlighted by the materials in this section of the paper. According to the Common European Framework's (2015) English Vocabulary Profile Online - American English, the noun *attribute* is a C2 level word, *characteristic* is B2, and *trait* is C2. Although two of the three target nouns are technically above the students' level, the goal is to move them from C1 to C2 by the end of the term, so it is acceptable to start introducing all three target nouns to students.

Materials

The following set of materials designed for one corpus-informed lesson that follows the Illustration-Induction-Interaction (I-I-I) cycle. First, Figure 15 displays a sample handout, representative of the Illustration and Induction steps.

Figure 15

Handout 1: Illustration and Induction

Instructions: In this task, examine the following concordance lines with *attribute (n.)*, *characteristic (n.)*, and *trait (n.)* from COCA's Academic register and answer questions about them. What patterns do you see in the use of *attribute (n.)*, *characteristic (n.)*, and *trait (n.)*? Some guiding questions have been provided to help you guess the patterns. You may work with a partner or in a small group.

1. *What are the important attributes that you consider while buying an apartment?* <ACAD: The Journal of Real Estate Research, 2016>
2. *Security is an important attribute of any good or service...* <ACAD: Energy Journal, 2000>
3. *...there was strong agreement across respondent groups on which two attributes (Usability and Performance/Audit Trail) were considered the most important...* <ACAD: Journal of Information Systems, 1991>
4. *Senge (1990) contends that a critical attribute to leadership is the ability to bring about a shared picture of the future.* <ACAD: Education, 1992>
5. *Our closeness to patients and the intelligence this provides is an important attribute in assessing health needs, and making informed decisions about the development of new services or improving existing ones.* <ACAD: Practice Nurse, 2011>
6. *The most typical student characteristics indicated a U.S.-born (65.7%) female (51.5%) majoring in accounting (29.8%) who started college at this university (52.2%) and who was working part-time (63.8%).* <ACAD: Academy of Business Research Journal, 2016>
7. *...the result of the physical and chemical properties of a particular element and the biological characteristics of the exposed tissue.* <ACAD: Natural History, 1990>
8. *Two demographic characteristics, parental absence and socioeconomic status (SES), were...* <ACAD: School Psychology Review, 1990>
9. *The results are listed as percentages, showing the percent of teachers who identified a specific characteristic as being associated with the potential school dropout (see chart B).* <ACAD: Education, 1990>
10. *Currently, the demographic characteristics of tattooed persons show wide variations in gender, age, social class, race, political party and occupation.* <ACAD: College Student Journal, 2015>
11. *Optimism is the trait that keeps him confident and motivated in the pursuit of the desired goal.* <ACAD: Academy of Entrepreneurship Journal, 2019>
12. *What can you do to develop innovative thinking traits?* <ACAD: Technology & Engineering Teacher, 2012>
13. *Unusual behavioral traits allow the fire ant to form large colonies and to dominate the territories it invades.* <ACAD: Bioscience, 1994>
14. *Possession of a sense of humor at any age is a socially desirable trait and children who possess it are more likely to be attractive to others.* <ACAD: Roper Review, 1991>
15. *These behavioral traits predict later engagement in substance abuse, violence, criminal behavior, and poor post-school outcomes that adversely impact the student's future, their family and their community.* <ACAD: Education & Treatment of Children, 2014>

Guiding Questions:

- A. What are the most frequent adjectives that occur before or after *attribute (n.)*?
- a. What types of adjectives are they?
 - i. descriptive vs. evaluative
 - ii. positive vs. neutral
 - iii. observable vs. latent
 - iv. other
- B. What nouns occur after *attribute (n.)*?
- a. What types of nouns are they?
 - i. abstract vs. concrete
 - ii. observable vs. latent
 - iii. living vs. non-living
 - iv. other
- C. What are the most frequent adjectives that occur before or after *characteristic (n.)*?
- a. What types of adjectives are they?
 - i. descriptive vs. evaluative
 - ii. positive vs. neutral
 - iii. observable vs. latent
 - iv. other
- D. What nouns occur after *characteristic (n.)*?
- a. What types of nouns are they?
 - i. abstract vs. concrete
 - ii. observable vs. latent
 - iii. living vs. non-living
 - iv. other
- E. What are the most frequent adjectives that occur before *trait (n.)*?
- a. What types of adjectives are they?
 - i. descriptive vs. evaluative
 - ii. positive vs. neutral
 - iii. observable vs. latent
 - iv. other
- F. What nouns occur after *trait (n.)*?
- a. What types of nouns are they?
 - i. abstract vs. concrete
 - ii. observable vs. latent
 - iii. living vs. non-living
 - iv. other
- G. What else do you notice about the use of *attribute (n.)*, *characteristic (n.)*, and *trait (n.)*? Based on the data, what questions do you have about their use?

Note. Adapted from Green (2019).

The structure of this handout was adapted from Green (2019) and contains a minimum of five concordance lines per target noun (*attribute*, *characteristic*, and *trait*) alongside guided questions with varying degrees of control. As students progress through the questions, the number of acceptable answers or interpretations is not limited to one. However, given the limited data set, the teacher can anticipate what types of responses students will give and continue guiding them through the generalization process by pointing to corpus data (e.g., the specific concordance line or number). This type of structure helps introduce students to the I-I cycle and to begin learning how to approach corpus data in general.

Next, Figure 16 displays a sample handout to promote Interaction with the target nouns and corpus tools. The structure of this handout was adapted from Nelson's (2006) Business English teaching materials based on semantic associations. In this case, students are asked to categorize the collocates of *attribute*, *characteristic*, and *trait* into the meaning groups (semantic categories) provided. As students deduce which collocate to match with each meaning group, the teacher can encourage them to use COCA's LIST, COLLOCATE, and COMPARE functions to confirm, refute, or refine their language hypotheses (Timmis, 2015).

Last but not least, Figure 17 displays a sample handout to promote further Interaction with the target nouns. It is vitally important that this writing activity comes after the Illustration and Induction steps. Without sufficient exposure to the forms, meanings, and uses of *attribute*, *characteristic*, and *trait*, students may find it very difficult to approach the task. The theme and goal of this handout are connected with the C1 and C2 skill set: 'characteristics of a successful student.' First, students form small groups and draft survey questions based on the theme. Second, the students will interview other students on campus and collect demographic data. Once each group has identified the top three *characteristics* of a successful student mentioned by participants, students will individually write a paragraph summary (150 words) to highlight the results. In the writing process, they will be asked to underline the target nouns that are used². Lastly, students will report their results to the class in a class presentation or poster session format. The benefit of ending the I-I cycle with this activity is that it can function as a formative assessment for the vocabulary unit.

² In this case, not using *trait* shows the understanding that it is not a feature that can be developed or created.

Figure 16
Handout 2: Interaction, Part One

Categorize the collocates of *attribute*, *characteristic*, and *trait* into the meaning groups provided:

attribute of security
attribute of a good/service
the enjoyability of class
characteristics of students
characteristics of participants
traits of substance abuse
traits of autism

standard or quality

demographic, species, or property

cognition, behavior, or genetics

standard or quality → *attribute*

demographic, species, or property → *characteristic*

cognition, behavior, or genetics → *trait*

Note. Adapted from Nelson (2006).

Figure 17
Handout 3: Interaction, Part Two

Interaction through ACAD Survey Writing (C1)

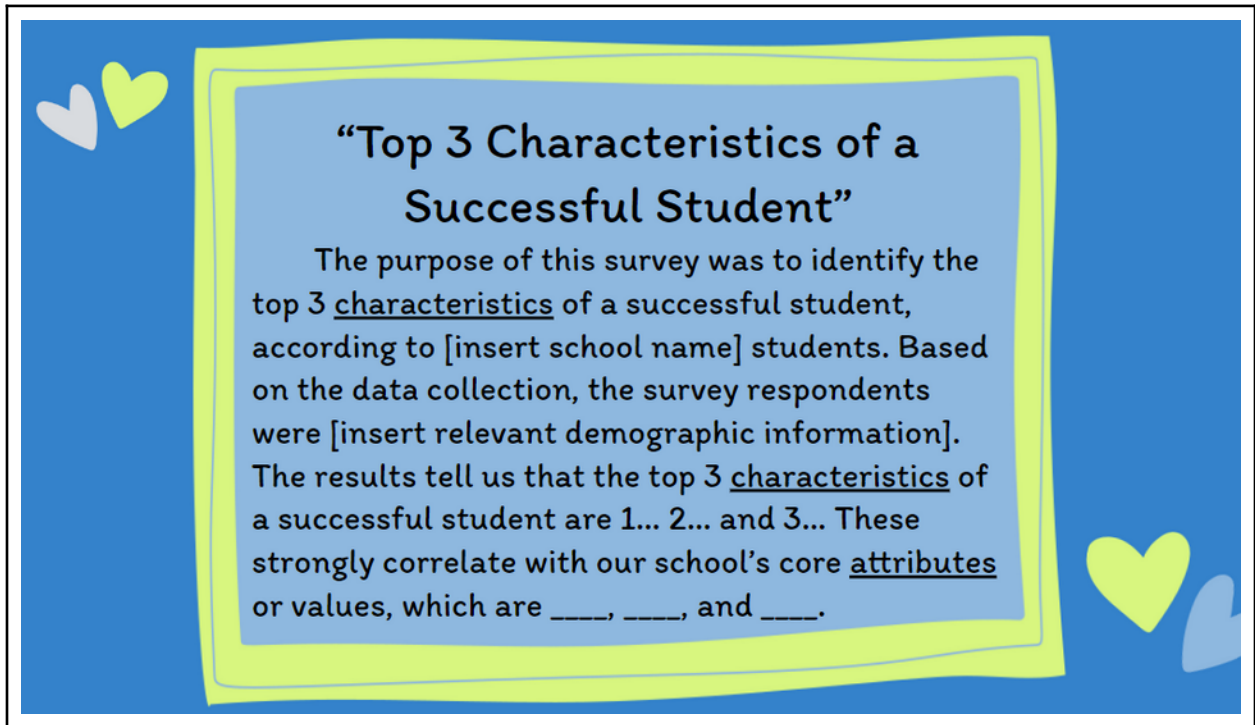

“Characteristics of a Successful Student”

Write a paragraph summary (150 words) to highlight the results. *Make sure to underline the target vocabulary – *attribute* and *characteristic* – in your writing.

- 1st**
In small groups, draft survey questions for the theme.
- 2nd**
Interview students on campus.
- 3rd**
Identify the top 3 characteristics of a successful student mentioned by participants.
- 4th**
- 5th**
Report to the class.

“Top 3 Characteristics of a Successful Student”

The purpose of this survey was to identify the top 3 characteristics of a successful student, according to [insert school name] students. Based on the data collection, the survey respondents were [insert relevant demographic information]. The results tell us that the top 3 characteristics of a successful student are 1... 2... and 3... These strongly correlate with our school’s core attributes or values, which are ____, ____, and ____.

Conclusion

When it comes to the application of corpus linguistics to teach plesionyms (or near-synonyms), there are many benefits and challenges. Some of the benefits include exposure to authentic, naturally occurring language in context and learner progression towards independent learning (Timmis, 2015; Friginal, 2018; Green, 2019). Using COCA, learners can build vocabulary banks dedicated to plesionyms and even create their own corpus based on the course text. Some of the challenges include the amount of corpus data, data randomization, and unfamiliarity with corpus query functions and techniques. All of these challenges are common reasons why teachers shy away from direct corpus use. Despite these familiar difficulties, plesionyms are context-dependent and require corpus analysis. The materials presented here, which present corpus data with added structure, are purposed to enable learners to discover the usage of the target phenomenon in context. Additional ways to develop students' ability to understand and use language in context include consulting experts within the target's high frequency registers (e.g., academic journals, web pages, popular magazines) and sub-registers (e.g., business, education, science/technology); exploring other corpora, such as parallel or learner corpora for cross-linguistic plesionym groups (e.g., L1 transfer in English to Japanese translation and vice versa); and implementation of student-initiated research (e.g., learners choose their own set of plesionyms to investigate) (Nelson, 2006; Hirst, 1995). One limitation of this study is its focus on a single corpus (COCA) and register (ACAD). There is potential to explore broader categories and corpora, such as parallel or learner corpora. Another limitation is insufficient data presented to represent patterns. Generally, the top 50 collocates and 10 concordance lines minimum should be presented for each pattern. The main searches were also limited to COCA's CHART, COLLOCATE, and COMPARE functions. In the end, there is always room for improvement and deeper exploration.

Appendix A

Answer Key for “Handout 1: Illustration and Induction”

Guiding Questions:

- A. “Important” occurs in Lines 1, 2, 3, and 5.
a. Evaluative, positive, latent.
- B. “Apartment” in Line 1, “security” “good or service” in Line 2, “usability and performance/audit trail” in Line 3, “leadership” in Line 4, and “health needs” in Line 5.
a. Abstract, latent, non-living.
- C. “Demographic” in Lines 3 and 10. Also, “typical” and “biological” in Lines 6 and 7.
a. Descriptive, neutral, observable, topical.
- D. “Student” in Line 6, “school dropout” in Line 9, and “tattooed persons” in Line 10.
a. Concrete, observable, living.
- E. “Behavioral” in Lines 13 and 15. Also, “confident” “motivated” in Line 1, “innovative thinking” in Line 2,
a. Descriptive, neutral, observable, relational.
- F. “Him” in Line 11, “you” in Line 12, “fire ant” in Line 13, “children” in Line 14, “substance abuse, violence, criminal behavior...” in Line 15.
a. Concrete, observable, living.
- G. ‘Attribute’ and ‘characteristic’ both show examples of of-phrases. Of-phrases are used with species nouns. Using a corpus, maybe I want to investigate of-phrases for ‘trait’ too?

Appendix B - Answer Key for “Handout 2: Interaction, Part One”

Answer Key:

standard or quality → *attribute*

security, good or service, the enjoyability of class

Answer Key:

demographic, species, or property → *characteristic*

students, participants

Answer Key:

cognition, behavior, or genetics → *trait*

substance abuse, autism

Appendix C - Answer Key for “Handout 3: Interaction, Part Two”

“Top 3 Characteristics of a Successful Student”

The purpose of this survey was to identify the top 3 characteristics of a successful student, according to [insert school name] students. Based on the data collection, the survey respondents were [insert relevant demographic information]. The results tell us that the top 3 characteristics of a successful student are 1... 2... and 3... These strongly correlate with our school’s core attributes or values, which are ____, ____, and ____.

About the Author

Sadie M. M. Nitta holds a BA TESOL degree from Brigham Young University – Hawai'i and an MA TESOL graduate from Hawai'i Pacific University. She has taught English in Hawai'i and Japan as well as contributed to corpus projects. Her main research interests are corpus linguistics, sociolinguistics, and peace linguistics.
